

The Standard Countdown Algorithm

- 1. Start
- 2. Accept the total countdown duration in seconds from the user.
- 3. Initiate a loop that runs as long as remaining seconds > 0.
- 4. In each iteration of the loop:
 - a. Divide total seconds by 60 to calculate total minutes and remaining seconds.
 - b. Format the output to a 2-digit digital clock structure (MM:SS).
 - c. Print the formatted string using a carriage return '\r' to overwrite the line.
 - d. Halt program execution for 1 second.
 - e. Subtract 1 from the remaining seconds counter.
- 5. Exit loop when remaining seconds hit 0.
- 6. Display a termination message (e.g., "Time's up!").
- 7. End

- 1. Start
- 2. user sets target time in seconds and types a whole number.
- 3. if number is negative or decimal keep asking user to enter number of seconds.
- 4. time is displayed in min and seconds
- 5. if remaining time is greater than zero
- 6. keep counting down
- 7. otherwise display Time off and end program
