

Version control

Git

What's covered in the Video:

1. Initializing Git
2. Adding files
3. Committing files
4. Setting a remote
5. Pushing files
6. Setting Git configurations

1. Setting Git Configurations

Before you start tracking history, tell Git who you are. This applies a global identity to your commits. [\[1\]](#)

- **Set your username:** `git config --global user.name "Your Name"`
- **Set your email:** `git config --global user.email "your.email@example.com"`
- **Verify settings:** `git config --list` [\[1\]](#)

2. Initializing Git

Transform your standard project folder into a local Git repository. [\[1, 2\]](#)

- **Navigate to folder:** `cd path/to/your/folder`
- **Initialize repo:** `git init`
- *Note:* This creates a hidden `.git` folder that tracks your history. [\[1, 2, 3, 4\]](#)

3. Adding Files

Prepare your modifications and new files for the next snapshot by adding them to the staging area. [\[1, 2\]](#)

- **Add a specific file:** `git add filename.txt`
- **Add all files in folder:** `git add .`
- **Check status:** `git status` [\[1, 2, 3\]](#)

4. Committing Files

Permanently save your staged changes as a concrete snapshot in your local version timeline. [\[1, 2\]](#)

- **Commit with a message:** `git commit -m "Your descriptive commit message"` [\[1, 2\]](#)

5. Setting a Remote

Link your local machine's repository to a hosted platform like GitHub or GitLab to allow collaboration. [\[1, 2\]](#)

- **Create a default branch:** `git branch -M main`
- **Link to remote cloud:** `git remote add origin https://github.com`
- **Verify the remote link:** `git remote -v` [\[1, 2, 3\]](#)

6. Pushing Files

Upload your local commits to the newly established remote repository cloud. [\[1, 2\]](#)

- **Initial setup push:** `git push -u origin main`
